*Don't let this happen to you!*

Over time fats, oils, grease, carbohydrates, proteins, cellulose, and urea can all build up in your septic system clogging the drain field and causing back ups, odors and lawn damage. The natural microbes that break down this septic waste are not always capable of keeping your septic system running optimally. In the worst case scenario, they fail to keep up with the addition of new waste and you are left with a wet, smelly, and dangerous back up spilling out onto your property. A back up can be an extremely expensive and dirty job to correct, often requiring excavation of your property to access the improperly maintained septic system. Applied quarterly by your Service Professional, SeptiTreat™ contains professional strength, premium natural microbes that digest septic waste to keep septic systems running smoothly and to prevent backups. Don't keep gambling with your septic system, ask your Service Professional to treat your septic system with SeptiTreat today.

Ask your Service Professional about other InVade™ technology natural microbial products to help with pet odors, stains and other household cleaning applications.
